

Test of Homogeneity of Variance

		Levene Statistic	df1	df2	Sig.
Percentage on SPSS exam	Based on Mean	25.055	1	98	.000
	Based on Median	24.960	1	98	.000
	Based on Median and with adjusted df	24.960	1	64.454	.000
	Based on trimmed mean	25.284	1	98	.000
Computer literacy	Based on Mean	.003	1	98	.959
	Based on Median	.037	1	98	.847
	Based on Median and with adjusted df	.037	1	83.139	.847
	Based on trimmed mean	.004	1	98	.953
Percentage of lectures attended	Based on Mean	5.830	1	98	.018
	Based on Median	3.105	1	98	.081
	Based on Median and with adjusted df	3.105	1	76.343	.082
	Based on trimmed mean	4.760	1	98	.032
Numeracy	Based on Mean	.211	1	98	.647
	Based on Median	.279	1	98	.598
	Based on Median and with adjusted df	.279	1	97.664	.598
	Based on trimmed mean	.238	1	98	.627

2. So if we only read this page, we will only find results that apply to this page. 3. As a researcher, we are always analyzing the same. 3. We don't really care if we are analyzing samples or entire. 4. We usually apply a statistical method to a sample, to produce a result for an entire. 5. We apply a statistical method to the data in this book, to discover a result for an entire. 6. Statistical methods are used to understand population distributions and relationships between samples. 7. A statistical method called a. 8. The term "analysis of variance" describes a statistical method that measures the differences between. 9. You can learn to use the SAS program in this book to perform a. 10. Statistical methods are used to find differences between populations and to understand their relationships. 11. Statistical methods are used to find differences between samples. 12. The term "analysis of variance" describes a statistical method that measures the differences between. 13. You can learn to use the SAS program in this book to perform a. 14. An analysis of variance (ANOVA) measures the differences between two or more populations or samples. 15. An analysis of variance (ANOVA) measures the differences between two or more populations or samples. 16. An analysis of variance (ANOVA) is used to measure differences between samples, and to understand relationships between samples. 17. An analysis of variance (ANOVA) is used to measure differences between samples, and to understand relationships between samples. 18. Statistical methods are used to find differences between populations or samples. 19. Statistical methods are used to find differences between samples. 20. An analysis of variance (ANOVA) is used to find differences between populations or samples. 21. You can learn to use the SAS program in this book to perform an analysis of variance. 22. An analysis of variance (ANOVA) is used to find differences between populations or samples. 23. An analysis of variance (ANOVA) measures the differences between samples. 24. You can learn to use the SAS program in this book to perform an analysis of variance. 25. An analysis of variance (ANOVA) is used to find differences between samples. 26. An analysis of variance (ANOVA) measures the differences between samples. 27. An analysis of variance (ANOVA) is used to find differences between populations or samples. 28. A statistical method called a. 29. An analysis of variance (ANOVA) is used to 82157476af
